www.Plant-Professionals.com

Plant Professionals® supports site efforts to address Respirable Crystalline Silica (RCS) dust.

◆ Technical Assessments

During our walkdown at your facility, our Plant Professionals® team will conduct a thorough technical assessment to determine sources of airborne RCS dust exposure. We provide a confidential report that will assess your current system identifying areas where RCS exposure could be a concern and recommending solutions to address those areas.

◆ Personnel Training

Our team can provide skill development and training for your personnel on how to recognize risks associated with silica dust and how to take necessary actions to mitigate such risks.

◆ Recommended Solutions

Following our site visit, we compile our findings and offer workable recommendations for dust reduction, such as integrating containment, suppression, and collection technology along with a review of operation and maintenance practices that will help your facility to be better prepared to comply with MSHA regulations for dust and silica.

All assessment reports are kept strictly confidential.

Our Plant Professionals® team is here to help! Contact us with any questions at info@Plant-Professionals.com.
